Abstract The objective of this study was to evaluate four forage crops, i.e. maize, wheat, cowpea and rice bean, for green fodder production under a low-cost hydroponic shed. The experiment was conducted under temperature-controlled condition, irrigation by micro-sprinkler and closed chamber by green agro-shed net cover. The result showed that green forage can be produced in 8 days from planting to harvesting using hydroponic technology. On overall basis, maize produced the highest quantity of green fodder per kg seed (8.40 kg) round the year, followed by wheat (7.11 kg), rice bean (6.75 kg) and cowpea (6.58 kg). The yield from maize and cowpea did not vary significantly with season, whereas wheat gave better yield during Rabi and rice bean during Kharif and summer.

Keywords Cereal · Dairy · Fodder · Hydroponics · Legume · Season

Green fodder plays an important role in feeding of dairy animals. It helps in optimization of production and reproduction performance by supplying the essential nutrients and provides bulk for effective digestion and also for gastro-intestinal tract motility [1]. It also helps in decreasing the cost of production by replacing a part of the concentrate in animal feeding. The conventional fodder production practice is not widely adopted in many regions

due to the requirement of large area of land per animal for cultivation, need of manure, fertilizer, and irrigation facility, pest and disease problem, intensive manpower requirement with a long growth time (45–60 days) along with non-availability of same quality green fodder round the year [2].

Hydroponic fodder is produced in greenhouses under controlled environmental conditions without soil. It can be done in a less space using limited amount of water and electricity along with marginal labour involvement [3, 4]. It also does not require fertilizers and pesticides, and the growth period is very less (7–10 days). In this practice, different seasonal fodder crops (both cereals and legumes) can be grown round the year. Besides the nutritional quality of the hydroponic green fodders is found to be better as compared to that of the conventional green fodder production [4, 5]. Hydroponic fodders are more palatable than the conventional fodders due to the difference in water and fibre content [4].

Even if there is an initial cost of installation of the structure, it can be sustainable. Keeping these facts in view, this study was designed to construct a low-cost hydroponic shed along with the provision of round-the-year fodder production and their seasonal variations in production of different fodders.

This study was conducted at the fodder wing of the Office of Chief District Veterinary Officer, Cuttack, for three consecutive years from 2013–2014 to 2015–2016 to establish this novel idea for the first time in the state of Odisha. The greenhouse was built up using locally available bamboo structure covered with agro-shed net and sides with three-rack system (Fig. 1). Provision of 60 kitchen trays was made for growing fodder in 8-day cycle and a micro-sprinkler system for giving regular and uniform irrigation. The cost of production and unit cost are

On the other side of the structure, a second elevator, receives a tray that was pushed as consequence of the previous movement. Growing light intensity measurement was 105 μmol/m²/s therefore, the lights were turned on at least 17 h/day to fulfill plant light requirement. The system read the pH level and nutrients on the nutrient solution of hydroponics system, as well as the temperature, humidity, CO₂ levels and the light intensity around the system; in addition there were LED light three lines each a different configuration on each line that was used for the lighting of plants and light color was selected and the system data were saved in SD Card.ARM cortex-M4 microcontroller (courtesy of developer arm).In addition, the system was capable to control desired concentration level with variation of less than 3%, pH sensor showed good accuracy 5.83% from pH value 3.23–10. The final position of the gripper was defined as 20 mm above the center of the cup. All parameters were taken in to consideration in order to create controlled environment exactly. The system saved water and fertilizer, but the water level in the reservoir must be checked with 2- or 3-weeks interval or water level sensor should be added to the controller circuit. solanacearum drastically reduced by the plasma treatment and is not detected after 8 days treatment. The program started up the sensor to read data sensors, push button to read the buttons provided, mixing to perform compounding nutrients hydroponics, timer flush to set watering plants, timer lights to regulate time lighting plants by LED lights. 2016;5:63-6612. These offsets are dependent on the position of the Kinect relative to the gripper. A Microsoft Kinect camera was added to the system, which produced two kinds of images, a 640 × 480-pixel RGB color image and a 640 × 480 pixel 11-bit (0-2047) gray scale depth image that was provided by an Infra-Red (IR) sensor. The microcontroller worked in real time to setup the alarms on nutrient pumps. Calcium and iron concentration in the culture solution were significantly decreased in AC-ED, consequently their contents were also found lower in crowns and roots compared to other solutions used. The water pumps were used for water recirculation and relays used to control both nutrient solution as well drain pumps. Automation of hydroponic installations using a robot with position based visual feedback. When the sensor is in the first storey, in a first elevator, the first tray is to be put in the second storey, 1-616. 2019;19(01):76319. Water, Media and Nutrient for Green House Crops. Sheikh BA. Hydroponic system design with real time OS based on ARM Cortex-M microcontroller. 2006;22:53-574. Journal of Physics: Conference Series. The position error was measured with a ruler at the final stopping position and robot then returned to the same starting position. The microcontroller switched on relaying to pumping water to the root territory only for 1 min. The initial pH of the solution was above the set point and kept on moving to reach the pH = 6. There were two buttons on the sidebar navigation. In that manner, the set point indicates that the fuzzy logic control can maintain the solution pH at the set point. In those cases, the neural network model did not encounter any difficulties predicting the rapid changes. Computers and Electronics in Agriculture. The pipeline structure consisted of six storeys and watering pumps performed system irrigation three times. Van LD, Lin YW, Wu TH, Lin YW, Peng SR, Kao LH, et al. IoT based hydroponics system using deep neural networks. IOP Publishing; 2017. In: Hydroponics—A Standard Methodology for Plant Biological Researches. A submersible pump operating at 12 DCV was installed inside the water storage tank. Ferentinos KP, Albright LD, Selman B. The core material of the PVC pipe tool with 3 in. The Kinect was placed on the carriage and its facing downwards (negative z-axis) to ensure the plants in its field of view are at a maximum distance of 1.5 m, because the accuracy of the Kinect decreases quadratically with distance. The cultivation space is optimized for the aeroponic plants are grown suspended in air, having as support PVC pipes which can be arranged horizontally or vertically, enabling a better exploitation of areas and installing a larger number of plants per square meter surface of the oven, obtaining thus a direct increase of productivity [2, 3]. Mehra M, Saxena S, Sankaranarayanan S, Tom RJ, Veeramankandam N. Journal of Electrostatics. RTOS ran all the tasks with a latency less than 15 μs. Environment sensor overall showed good result, temperature reading error was less than 4%, humidity reading less than 5.36% and CO₂ sensor accuracy was calibrated 260 ppm from initial value. The OpenNI driver transforms the IR sensor values into distances in meters by using a fitting function. Scientia Horticulturae. If the system was turned on, the computer program turned off three pumps (str pump, water pump and the dosing pump). Talukder MR, Asaduzzaman M, Tanaka H, Asao T. The depth information was extracted from the depth image by getting the value at point. The above advances will improve the efficiency of hydroponics to increase the quality and quantity of the produce and pose an opportunity for the growth of the hydroponics market in near future.hydroponic systemsensorsmicrocontrollersautomationneural networksroboticist is estimated that the total world population could reach 9.15 billion in 2050 [1], and to increase the global food production, even more advances in agriculture must be made intensive in crop yields and in practices that are more friendly with the environment. In this transformation, the point is the principal point in pixels of the depth sensor and the focal lengths in pixels were calculated. 2014;27(2):809-82214. The microcontroller received this voltage signal and compared it with the previous value and decided based on that input signal. The performance of the system on bacteria inactivation in the nutrient solution was evaluated in a continuous treatment system operation and the results showed that the standard plate count for background microflora and R. Some connection apparatus and valves were used in the irrigation system to integrate all items.Grapevine experimental setup.At the beginning of the test, all substrates were filled up to field capacity, then the automated system started irrigation at 4 h intervals and run the submersible pump only 1 min throughout the whole growing season so that this irrigation management kept the soil moisture at the level of field capacity in each substrate since excess water was drained to the reservoir back after each irrigation event. In addition, some Raspberry Pi 2 microcomputers served to accommodate the webserver and brokers. The model was capable of predicting pH at the next 20-min time step within 0.01 pH units and EC within 5 μS cm⁻¹. RTOS performance was obtained using square wave input signal and measuring input signal versus output signal delay using oscilloscope. The gripper must be ±15 mm in x-direction, ±20 mm in y-direction and ±10 mm in z-direction from the center of the cup to allow the robot to pick up the plant. We thank the Universidad Autónoma de Nuevo Leon, Mexican Ministry of Education, as well as Mexican Council for Science and Technology for their support.1. Alexandratos N, Bruinsma J, Tanke NF, Long GA, Agrawal D, Valada A, Kantor GA. To manipulate the plants, the robot (Figure 24) was designed as a gantry with four v-grooved wheels running on two inverted angle iron tracks (x-axis). In: 5th International Conference on Cyber and IT Service Management (CITSM): IEEE. Automatic sensors not only have the ones that can be read at predefined intervals, but also the readings of these sensors are stored so that higher results can be obtained for analysis and diagnosis resulting in higher crop yields and friendlier practices with the environment. The second automation page contained a selection of plants type which pH and ppm value have been set before, so farmers only need to choose the type of plants that they maintained to grow. The system started working by using of sensors connected to the electrode. Compared to renewed solution, fruit yield was decreased to about half (114.0 g plant⁻¹) in non-renewed solution while non-renewed with DC-ED produced intermediate yield between non-renewed and renewed solution or non-renewed with AC-ED. It was concluded that growth performance was greatest in renewed solution followed by non-renewed with AC-ED, while it was decreased significantly in non-renewed solution with DC-ED similar to non-renewed solution with DC-ED similar to non-renewed solution with DC-ED. The robot (Figure 24) was designed as a gantry with four v-grooved wheels running on two inverted angle iron tracks (x-axis). hydroponic systems. The focus is on the implementation of a position-based visual feedback (PBVF) algorithm in combination with a Microsoft Kinect. The system events successfully for the whole growing season. Matos J, Gonçalves PJ, Torres PM. Once the water was activated, then timer watered the plants. The embedded system kept the plant growth media in 10 min, before it then flows back into the tank and flows into the next block. Pots were irrigated with the same amount of nutrient solution. CO2 data retrieval between MH-Z19 sensor and measuring devices at room had a difference for each room relatively equal amount, then for the sensor MH-Z19 in this case with a correction factor, so the results obtained are close to the results of measuring instruments. The plant coordinates form the control input for the robot. The development phase of the fodder was tested, and validated, which benefits the agricultural holding [12].HES was developed to minimize the labor force used in the process of hydroponics, the total amount of time spent in agricultural process, human-based errors, as well as, the control of hydroponics greenhouse plant production. Growing media: Types and physical/chemical properties. The nutrient solution control is also performed in the PLC, to control the pH and electric conductivity, while mixing the nutrients and the control sequence of the trays in the hydroponic system.Power circuit (a), sensor circuit for the unloading part (b) and actuator circuit for the elevator one (c).This sequence definition is a high-level control task, while the low-level actuator control is performed in inner loops and is programmed directly on the motor drives. An expert system design and application for hydroponics greenhouse systems. The computer program for the control system was developed using the Pascal language in DOS environment (Figure 12). Automation settings pages were divided into two parts: first part with its own set of pH and ppm values are desirable way entering the value in the textbox. The difference of humidity data retrieval between DHT22 sensors and measuring devices was very small. Two linear actuators were used to open and close the gripper and the other linear actuator was used to rotate the gripper around the y-axis. At the end of the arm was placed a two degrees of freedom gripper which opened, closed and rotated around the y-axis.Robot manipulator arm.The structure is made primarily from aluminum that allows the robot to be adjusted to accommodate different sizes of NFT hydroponic systems. Fonteno WC. The initial position of the gripper is defined as the middle between the points of the gripper so the x, y and z-position error can be measured. 109(1). The control action was based on decision matrix in which there are criteria of Quick Acid (QA), Fair Acid (FA), Slow Acid (SA), Neutral (ZO), Quick Base (QB), Fair Base (FB) and Slow Base (SB).The measurement result of the pH of nutrient solution was in the analog form of DC voltage and was transferred to defuzzification by means of weighting to the absolute membership value from every label with the membership degree obtained. The results showed that hydroponic automated system performed well. Automated hydroponics nutrition plants systems using arduino uno microcontroller based on android. The z-coordinate has to be offset by an extra value, because the NFT table is under an angle of 2.2°. The input parameters prepared the optimum growth environment for the plants. The rate of hydroponic plant growth was faster when compared with plants with soil-grown systems. The developed control algorithm was based on membership functions of fuzzy arrangement.Embedded and flow system with pH control system.Fuzzy rules had 21 linguistic statements to achieve smoothness, by trials and errors using the membership functions based on the operator skills and experience. Finally, the developed network, only considered two first kinds, mechanical and sensor faults. Each image was analyzed to detect the plants. Finally, we raise topics related to robotics for hydroponic systems (Figure 6). If the area or volume of culture is large, several sensors must be placed to adequately control the entire crop. Hommons used a 20 W solar system, which consisted of a solar cell panel, controllers, battery and DC to AC inverters. The fuzzy logic controlled nutrient solution pH and increased the smoothness of the pH the during control course. The required water was supplied by using 16 inches of diameter pipes with 4 L h−1-drippers at a spacing of 33 cm, with three drippers serving each pot. The hydraulic circuit comprised the valves, nutrients and water reservoirs, the six storeys pipeline with the irrigation micro-jets, and the 2 m3 water return reservoir with the two redundant pumps. Microcontroller (Arduino Uno) will control the flow of nutrient solution on the vessel automatically, and the microcontroller can be controlled from Android smartphone. To decrease the pH toward the set point it requires 68 s. The system initially provided nutrients for 5 mL and then the system recorded and calculated the amount of nutrients needed. The growth period of the plant is determined by adding the values of plant drain degree, plant nutrition degree, plant deterioration degree, plant photosynthesis degree and plant growth degree. 2019;12:315-3248, renewed, non-renewed, non-renewed with direct current electrodegradation (DC-ED) and non-renewed with alternative current electro-degradation (AC-ED). Trejo-Téllez LJ, Gómez-Merino FC. 2002;45(6):200718. Open access peer-reviewed chapterSubmitted: April 20th, 2019 Reviewed: November 11th, 2019 Published: December 27th, 2019DOI: 10.5772/intechopen.90438Hydroponic system requires periodic labor, a systematic approach, repetitive motion and a structured environment. Ferentinos KP, Albright LD. If alarm is deactivated, the relay will be turned off and the pump will stop supplying. The x-axis was driven by a stepper motor and a chain. This process is repeated until the tray reaches the end. The system mechanism worked as follows: HC-SR04 ultrasonic sensor detected the height value of nutrient solution in hydroponic plants by the parameter of the high of water (in cm) unit and the temperature. C1429Submitted: April 20th, 2019 Reviewed: November 11th, 2019 Published: December 27th, 2019© 2019 The Author(s). The system controls the actuators of the mechanical structure. When taking data for RTOS experiment (Figure 10), the main programs still running while the experiment still ongoing.Experiment of RTOS.The yellow signal is a given signal and the other signal is a signal output from each thread. The nutrient solution flows into and fills the cultivation bench until a certain level, 5–10 cm from pot base. To accomplish with this, hydroponic systems must collect a lot of information, since this allows a better diagnosis of the problems and better understand the development of hydroponic crops. All software was programmed in C++. Hommons hardware design relationship of the NFT consisted of sensors, actuator, microcontroller, ESP8266, wi-fi access point, microcomputer (Raspberry Pi) and power supply. Every numeric variable was plotted into a fuzzy system consisted of Large Positive (LP), Fair Positive (FP) and Small Positive (SP), Zero (ZO), Large Negative (LN), Fair Negative (FN) and Small Negative (SN). The valve used was of solenoid type with 1/8 in. Growth control of leaf lettuce with exposure to underwater ultrasound and dissolved oxygen supersaturation. Automatic LED lighting, water spray, water pump and so on were included in the developed plant-care intelligence included and so on. This tray is then elevated to the next storey.

Subaru's EJ251 and EJ252 were 2.5-litre horizontally-opposed (or 'boxer') four-cylinder petrol engines. For Australia, the EJ251 engine was first introduced in the Subaru BE/BH Liberty in 1998 and subsequently offered in the BH Outback, GD/GG Impreza RS and Subaru SG Forester. For the Subaru BL/BP Liberty and BP Outback, the EJ251 was replaced by the EJ252 engine. An IDM Properties & Services maintenance call system has been put online to facilitate a more efficient service to the IDM research groups with regards the logging of maintenance jobs and their subsequent monitoring.
